

Project Name: Stake
Team Name: Productivity Masters

Team Roles

Product Owner: Ronin Mithaug
Scrum Master: Connor Opdyke
Development Team Lead: Miguel Rosario

Programming Languages/ technologies

Languages : Javascript, SWL, CSS
Tech Stack: PERN
Frontend: React
Backend: [Node.js](#) with Express
Database: PostgreSQL
Project Management: Github and Jira

Solution to Challenge statement.

Our solution is a social productivity app that helps users reach their goals by putting something on the line. Most productivity apps rely on self-discipline, which is easy to ignore when no one is watching. Our app however adds real accountability by having users stake an embarrassing photo of themselves on each goal. If they fail to follow through with their goal that photo is posted to their friends feed. The idea is that the pressure of not wanting friends to see the photo and know they failed their goal pushes users to complete their goals consistently.

Project Vision

For people that want to be more productive who need help managing their goals, the Stake app is an accountability platform that allows users to “stake” embarrassing photos of themselves to highly motivate users to complete their goals. Unlike Habitify, which relies on reminders that are easy to ignore, our product creates social pressure by making users' progress visible to friends and a personal stake for each goal.

Risk Management

Risk	Type	Probability	Effect	Avoidance
User uploads an inappropriate stake photo	Business	High	Serious	Allow users to report inappropriate photos. Admins can see reported actions and choose to ban users. Knowing they can be reported and

				banned discourages users from uploading inappropriate photos.
User uploads a check in photo that does not show them completing their goal	Product	High	Tolerable	Check in photos will be added to the feed where users can flag photos that look fake, admin can then go in and verify or deny.
The automatic posting feature fails or releases a stake photo by mistake because of time zone issues	Product	Moderate	Serious	Store all deadlines in one standard timezone and write test for edge cases.
